

# Are your devices and applications secure?

Enterprises need to secure communications between a multitude of devices and their end users. Secure Sockets Layer (SSL) and Transport Layer Security (TLS) certificates provide a layer of encryption between sites to prevent intruders from acquiring sensitive information. However, maintaining a consistent level of security on every device is a challenge. How do you plan to protect your business?

## Know What's Protected

Though SSL/TLS certificates are key to managing security, they present a significant logistical challenge. Each certificate has its own activation, expiration, and renewal date, which forces enterprises to manage thousands, if not millions of individual checkpoints to ensure every device and application is protected.

BMC Helix Discovery's SaaS-based, agentless discovery and dependency modeling solution helps IT teams discover security certificates on all their assets and applications. Within minutes, security experts can obtain an up-to-date list of security certificates and their expiration dates across cloud-native and on-premises environments.

## Start Anywhere Application Modeling

Discover assets and create application models from any starting point in the IT infrastructure within minutes.

## Up-To-Date Certificate Reporting

Observe and process detailed information on the latest status of each certificate, which enables proactive planning for updates and refreshes.

## Dynamic Dependency Modeling

Leverage relationships between certificates and business services, which enables teams to prioritize updates, plan maintenance, and prevent unplanned outages.

## Industry-Leading Asset Library

Leverage a robust library containing over 15 years of asset data, including support for datacenter, public cloud and container technology, 40,000+ software versions, 6,000+ network devices, 30+ storage brands, 1,000's of relationship types, 100+ middleware, 25+ DevOps technologies.

74% of IT and security experts believe their organization does not know how many keys and certificates they have, much less where to find them when they expire.\*
